Monitor Solution for Servers

.....
IMPROVING OPERATIONS AND ENHANCING PERFORMANCE

Monitor Solution™ for Servers ensures server availability and reduces costs associated with server downtime through comprehensive, web-based performance and event monitoring. Use real-time monitoring to assess current operational states, view historical data to identify trends and isolate recurring issues, and manage problem tasks with integrated alert management.

BENEFITS

- > Lower cost of ownership through centralized management, quick implementation, and ease of use
- > Avoid lost revenue by minimizing server downtime
- > Improve IT staff efficiency
- > Restore server operations more quickly
- > Easy-to-use web-based interface provides anywhere access

EASY TO USE

Monitor Solution for Servers minimizes the work you need to do by discovering servers to monitor, deploying new agents, and distributing predefined rules. As your organization's needs change, you can easily customize monitoring rules for maximum flexibility. If you repurpose a server or modify its installed components, Monitor Solution's agent will automatically detect installed or uninstalled server applications to intelligently enable and disable rules. With Monitor Solution for Servers you can rely on our out-of-the-box knowledge or configure exactly what you want to monitor in your environment.

COMPREHENSIVE MONITORING

Monitor Solution for Servers proactively monitors server health and network availability to improve your IT operations. For comprehensive monitoring, monitoring policies analyze data from a variety of sources including performance counters, WMI, NT events, ports, SNMP, and application logs. Performance data is recorded, compressed, and saved in a centralized database providing the most extensive and granular performance history using the least amount of space.

FLEXIBLE NOTIFICATIONS AND ALERTING

Monitor Solution for Servers continually gathers and summarizes data to keep your servers up and running 24 hours a day. A "dashboard" console provides enterprise-wide status of all monitored servers. If the enterprise status indicates a problem, you can drill down for additional details, and then quickly determine which computers need attention. You can configure Monitor Solution for Servers to automatically notify administrators through e-mail or an integrated alert management console. Using the Altiris Alert Manager™ console, administrators can track each problem and maintain a history of the issue. Monitor Solution's notification and alert features ensure that problems are addressed quickly and accurately.

ADVANCED DATA VIEWS

When a critical threshold is crossed, determining the root cause isn't always a simple task. Monitor Solution's Performance Monitor console provides all the data you need in one consolidated view. And it's available whenever you need it – you can view real-time data for quick performance checks or replay historical data from last night or the week before. By looking at critical performance parameters, events, and processes at the same time, you can easily determine whether last night's CPU spike was due to SQL or another application. Access to comprehensive system data simplifies problem diagnosis, restores server operations more quickly, and improves your staff's efficiency.

SERVICE LEVEL REPORTING

Monitor Solution for Server includes numerous pre-packaged Web Reports™ that help you track monitored data from any web browser. Use these reports to track service levels by reporting overall availability of monitored computers or tracking IT staff responsiveness to generated alerts. Additional reports allow you to easily visualize server performance for a variety of categories, such as memory, processor, or disk. All Web Reports include a standard drill-down feature that turns any browser into a management information system and can be customized to meet your organization's particular needs.

“Altiris Monitor Solution will not only enable us to monitor our system resources and applications in real-time, but will also give us historical performance reports so we can identify and analyze trends. We already use Altiris software to manage our IT infrastructure so the integrated user interface will allow us to manage our entire environment using a single management solution.”

– DANNY DOUBTFIRE
Operations Manager
Financial Ombudsman

Monitor Solution for Servers' Performance Monitor Console provides comprehensive system data for isolating issues. In a single view you can look at real-time or historic data on performance counters, processes, NT events, and TCP/IP port states.

You can easily customize monitoring rules and access extensive reporting with an easy-to-use web-based interface.

SYSTEM REQUIREMENTS

Monitor Solution for Servers requires that you install and configure the Altiris Notification Server™.

Notification Server Minimum Requirements

- > Processor – Pentium® III 800 MHz processor or faster
- > Memory – 1 GB RAM
- > Hard drive – 20 GB
- > Operating system – Windows® Server 2003 or Windows 2000 Server
- > Database – Microsoft® SQL Server 2000 SP3
- > Browser – Microsoft Internet Explorer 6 or later

Agent Minimum Requirements

- > Processor – Pentium III processor
- > Operating system –
 - > Windows Server 2003, Standard Edition
 - > Windows Server 2003, Enterprise Edition
 - > Windows Server 2003, Datacenter Edition
 - > Windows Server 2003, Web Edition
 - > Windows 2000 Server
 - > Windows 2000 Advanced Server
 - > Windows 2000 Datacenter Server
 - > Windows NT Server 4.0
 - > Windows NT 4.0 Enterprise Edition
 - > Windows NT 4.0 Terminal Services Edition
